

# SEPARO

.....SeparoUXcf·XY·9gVfJU

The cross separator "SEPARO" has been devised with the scope to recover from working oxides, than unavoidably free alloys are produced during the processes worked to you with alloys of pond (are they lead or lead free), the greater alloy amount that instead would be destined to the normal centers for the elimination of refuse products recording in the costs of purchase and elimination of the same one. SEPARO works taking advantage of the various specific weights of the materials to divide which, capacities to elevated temperatures more are divided mechanically obtaining an alloy to re-use having characteristic identical to the present alloy in the crucibles from which it is captured. SEPARO is in compliance with norm CE.
